COMP20003 Workshop Week 10

- 1 Graphs: concepts
- **2** Graph representation
- **3** DFS (and when to use?)
- 4 BFS & Dijkstra's Algorithm Lab: Implementation pq

Graphs

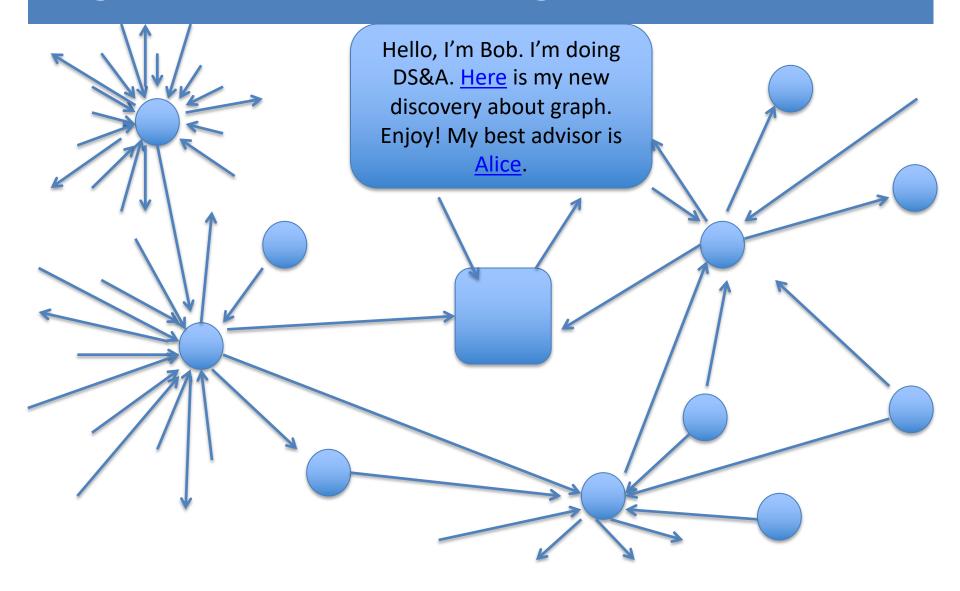

Source: https://www.researchgate.net/figure/An-example-of-the-type-of-graph-produced-by-contact-tracing-Each-node-represents-an_fig2_48693783

a small graph of covid-19...

An example of the type of graph produced by contact tracing. Each node represents an infected individual, and each line connects two individuals who have been in contact

PageRank: Bob becoming famous!

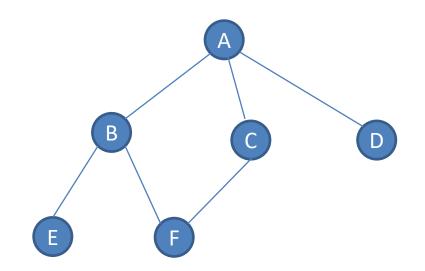

Graphs: Concepts

```
Formal definition: G= (V, E) where \( \nabla = \{\nabla_i\}\) : set of vertices, or nodes \( \text{E=} \{(\nabla_i, \nabla_j) | \nabla_i \in \nabla_j\} \) : set of edges, arcs, or links; \( \nabla \) is called the order of the graph \( \nabla \) is called the size of the graph
```

- dense and sparse graphs
- directed, di-graph, undirected,
- cyclic, acyclic, DAG
- connected and unconnected graph, connected component
- weakly and strongly connected components

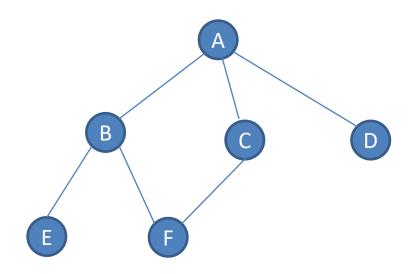

Graph representation: Example for unweighted, undirected graph

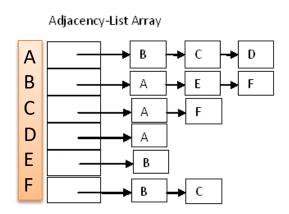

How to represent the graph using:

- Adjacency matrix
- Adjacency lists

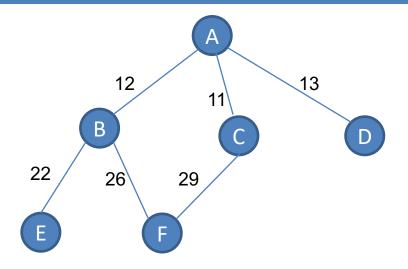

Example for unweighted, undirected graph

	Α	В	С	D	Ε	F
Α	0	1	1	1	0	0
В	1	0	0	0	1	1
С	1	0	0	0	0	1
D	1	0	0	0	0	0
Ε	0	1	0	0	0	0
F	0	1	1	0	0	0

Note: (Weighted) Graph presentation in programs

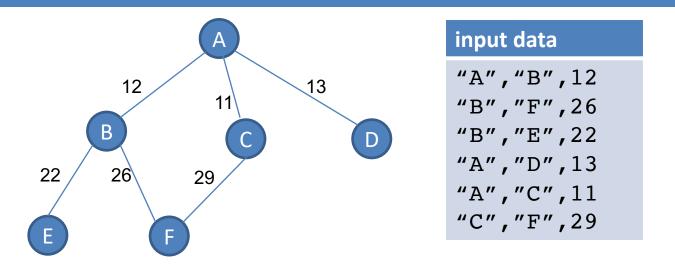

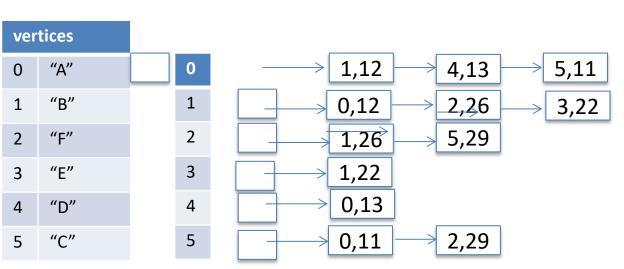

input data

0 "A"
$$[0] \rightarrow (1,12)$$

1 "B" $[1] \rightarrow (0,12), (2,26)$
2 "F" $[2] \rightarrow (1,26)$

(Weighted) Graph presentation in programs

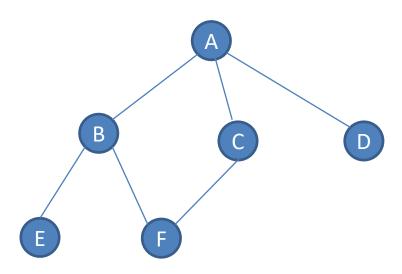

Graphs: Representation

What is a suitable representation method for:

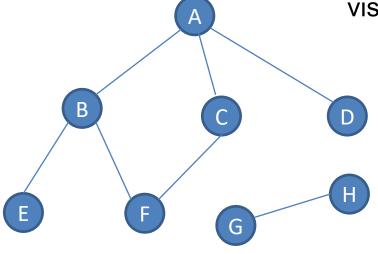

- a graph of this on-line class, where nodes represent students, edge (a,b) means "a knows b",
- a graph of this would-be-face-to-face class, where nodes represent students, edge (a,b) means "a knows b"
- the webgraph?
- social-distancing graph for people in Australia
- road network between major cities in Australia

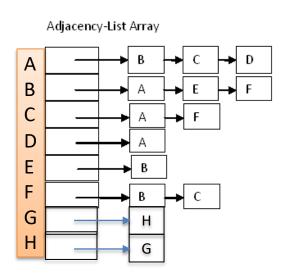

Is each graph directed/undirected, weighted/unweighted, cyclic/acyclic, dense/sparse?

Graph Traversal = What? How?

(Connected) Graph Traversal = How: DFS vs BFS

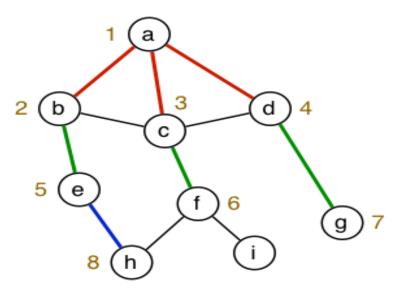

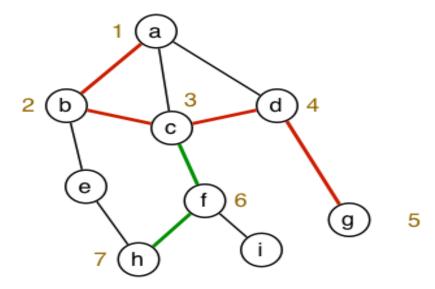

visit each node exactly once, in a systematic way

```
//mark all nodes as "unvisited":
visited[u]= 0 for each u= 0..|V|-1
order= 0;
for each node u {
  if (!visited(u)) visit(u);
function visit(int u) {
  S= empty data structure
  insert u in S
  while (S not empty) {
    u = remove from S
    if (!visited[u]) {
       visited[i]= ++order;
       do job with u;
       insert all neighbours of u to S
```

Graphs: DFS & BFS

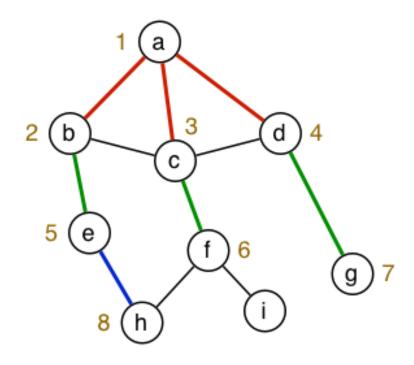

Depth-first Search

```
When S is a queue, we have Breath-First Search (BFS)
```

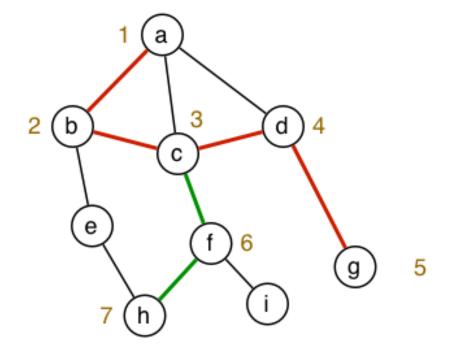

```
function visit(int u) {
   S= empty data structure
   insert u in S
   while (S not empty) {
        u = remove from S
        if (!visited[u]) {
            visited[i]= ++order;
            do job with u;
            insert all neighbours of u to S
        }
    }
}
```

When S is a stack, we have Depth-First Search (DFS)

Graphs: DFS & BFS

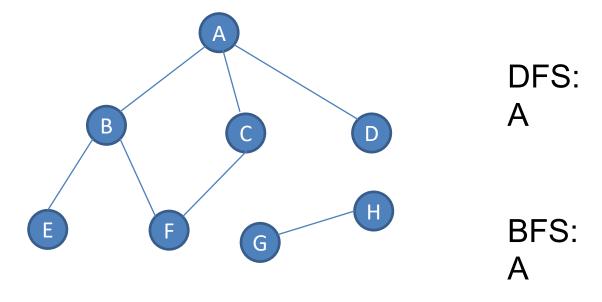

Breadth-first Search

Depth-first Search

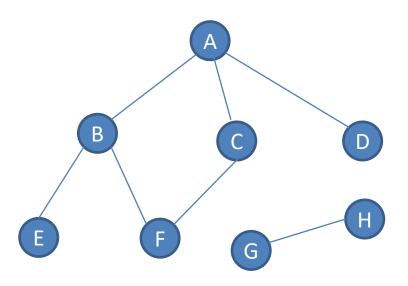

Exercise: List nodes in order visited by a)DFS and b)BFS

Notes: In exercises, ties should always be broken in alphabetical/ascending order

Exercise: List nodes in order visited by a)DFS and b)BFS

Notes: In exercises, ties should always be broken in alphabetical/ascending order

The loop:

```
for each node u {
  if (!visited(u)) visit(u);
}
```

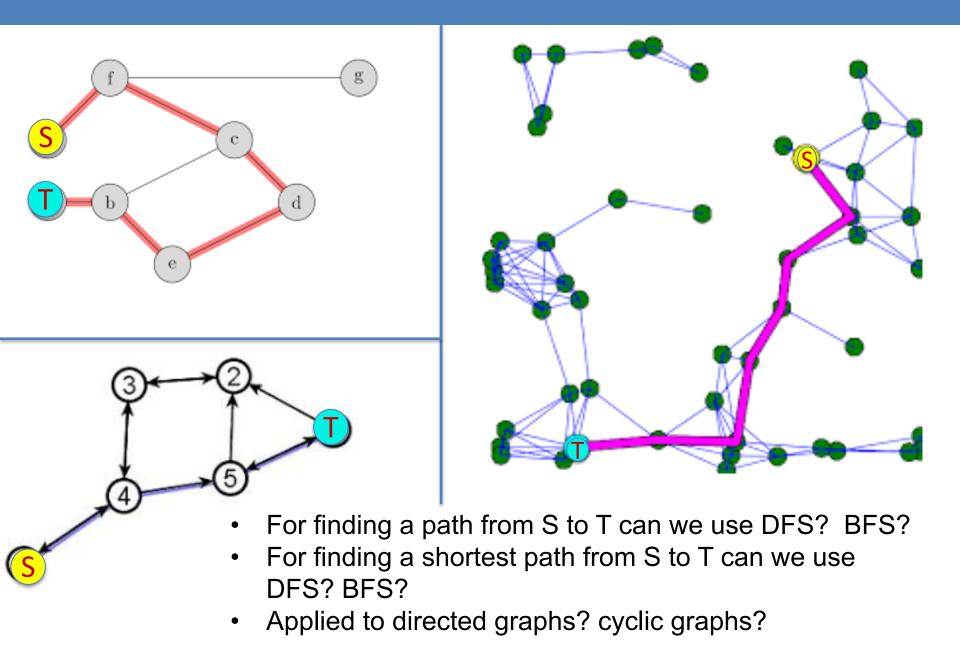

will call functions visit() 2 times (and that is also the number of connected components in the graph) in both BFS and DFS:

- the first call is for node A (which visit nodes
 A, B, C, D, E, F and mark them as visited
- the second call is for G, which will visit and mark
 G, H as visited

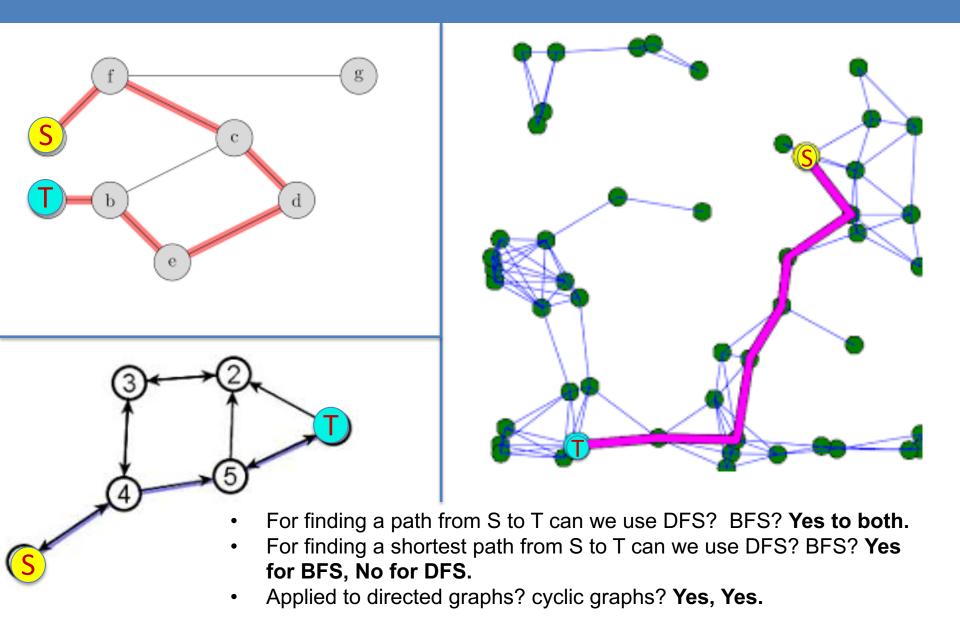

Order visited by DFS: ABEFCDGH
note: after visiting C the algorithm attempts to
visit A, which has already been visited → cycle

Order visited by BFS: ABCDEFGH note: how to recognize cycle?

Paths in unweighted graphs: path length, shortest path

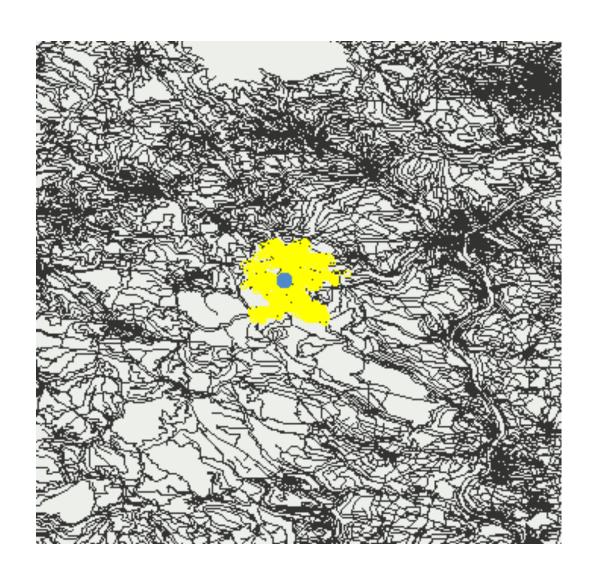

Paths in unweighted graphs: path length, shortest path

for shortest path: use Breath-first Search (BFS)

an illustration of BFS

visitBFS: BFS from a single vertex

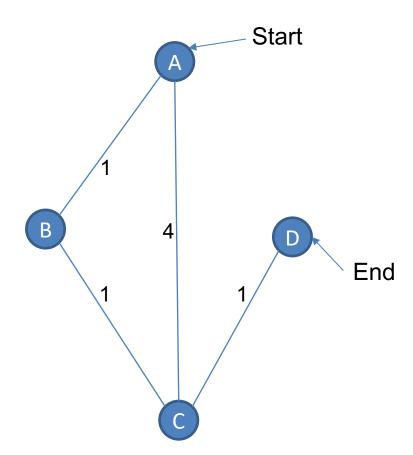

The task:

- Given a weighted graph G=(V,E), and s∈V
- In the BFS manner, visit all vertices which are reachable from s.
- supposing visited[] and order have been set

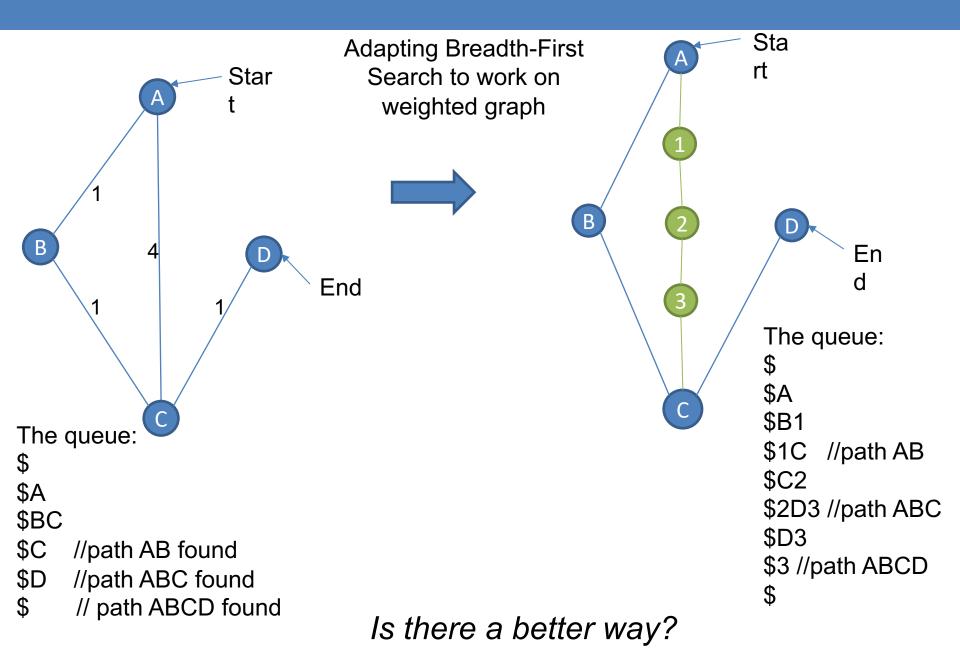

```
The algorithm (using global visited [|V|] = \{0\}, order= 0;)
visitBFS(s) {     // similar to visit(int u) seen before
   Q= makeEmptyQueue()
    enQ(Q,s)
   while (Q is not empty) {
       u = deQ(Q)
       if (!visited[u]) {
          visited[u]= ++order
          visit(u) // performs some operations on vertice x
          for all v that (u, v) \in E: enQ(Q,v)
```

Exercise: Using BFS to find shortest paths in weighted graphs?

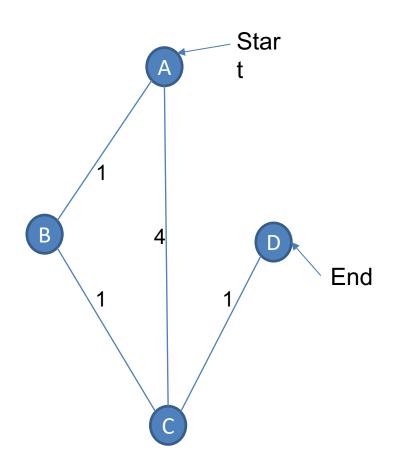

How to use BFS for finding shortest paths in weighted graphs, supposing weights are positive integers?

Exercise...

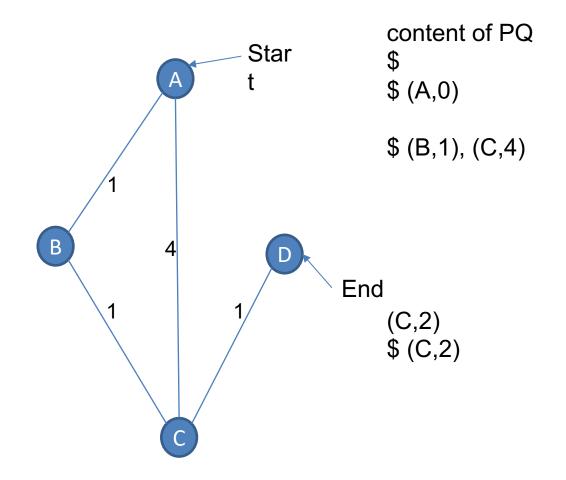

Finding shortest paths using priority queues

```
content of PQ
$ (A,0)
                     insert A with distance A \rightarrow A = 0
(B,1), (C,4) done with BA \rightarrow B:1
```

Finding shortest paths using priority queues

\$ is front of the PQ, PQ is empty now insert A with distance $A \rightarrow A = 0$ done with A, path $A \rightarrow A = 0$

done with B, path A→B = 1 would insert C with distance= dist(A,B) + dist(B,C) =2 But ... we should replace (C,4) with

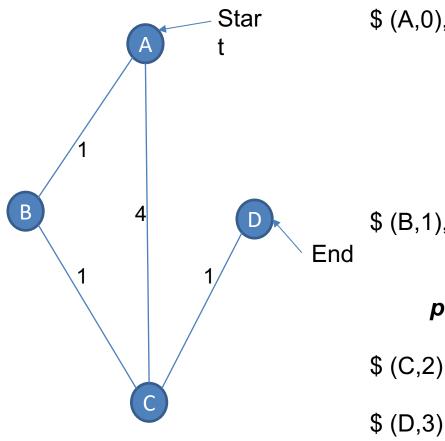

. . S it va.

→ it would be easier just to populate the PQ with all vertices from the very start

Finding shortest paths using priority queues

\$

Now we put all vertices into the queue at the start. The content of PQ will be:

```
(A,0),(B,\infty),(C,\infty),(D,\infty)
              populate queue with all nodes
              then remove min-dist A
                 Done= \{ (A,0) \}
              and update distance for the
                 neighbours of A
$ (B,1), (C,4), (D,∞)
              remove B that has min dist
                 Done= \{(A,0), (B,1)\}
      prove that : A→B is a shortest from A to B
               update...
$ (C,2), (D,∞)
                 Done= \{(A,0), \{B,1\}, (C,2)\}
```

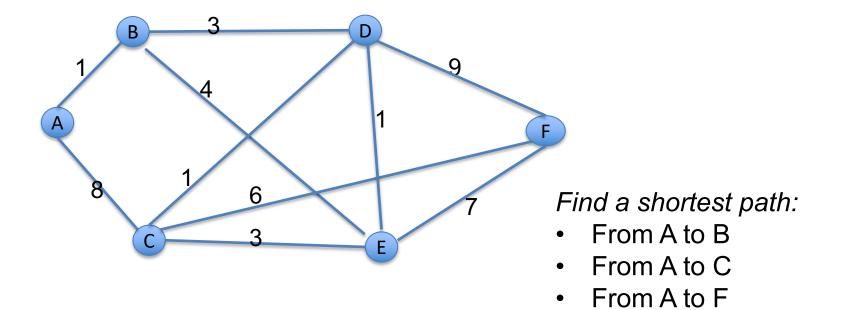

So the shortest path A→D has length 3, but what is the path?

Done= $\{(A,0), \{B,1\}, (C,2), (D,3)\}$

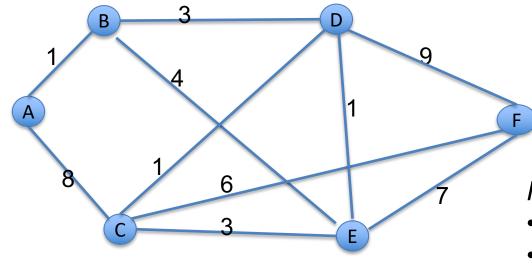

Dijkstra's Algorithm: Single Source Shortest Path SSSP

The task:

- Given a weighted graph G=(V,E,w(E)), and s∈V, and supposing that all weights are positive.
- Find shortest path (path with min total weight) from s to all other vertices.

From A to any other node

Find a shortest path:

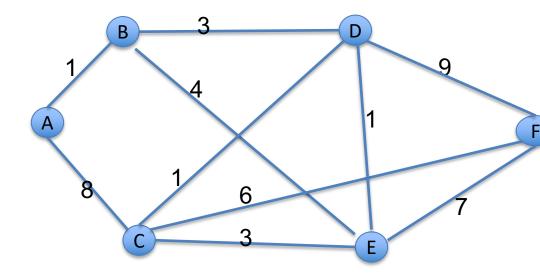

- From A to B
- From A to C
- From A to F
- From A to any other node

done	Α	В	С	D	E	F
	0, nil	∞,nil	∞,nil	∞,nil	∞,nil	∞,nil
Α						

this column: nodes with shortest path found

dist[B]:
shortest-so-far
distance from

pred[D]: node that precedes D in the path A→D

4 The dist at SA is 0, there is an edge A->C with length 8, so we can reach C from A with distance 0+8, and 8 is better than previuosly-found distance of ∞

В

done

Α

Find a shortest path:

- From A to B
- From A to C
- From A to F
- SP A->F=

F

The "-" is shorthand for "∞,nil"

4 non-empty cells means there are 4 elements in the heap

	0, nil	∞,nil	∞,nil	∞,nil	∞,nil	∞,nil
А		1,A	*8,A	-	-	_
В			8,A	4,B	5,B	-
D			5,D		5,B 🥿	13,D
С	Update this ce				5,B	11,C
Е	D with distance 1 (of edge D-)					11,C
С	better th	**				

C

D

Ε

At this pointy, we can reach E
from D with distance 4 (of D) + 1
(of edge D→E), but new distance
5 is **not better** than the
previously found 5, so no update!

Find a shortest path:

- From A to B
- From A to C
- From A to F
- SP A->F=

What's the found shortest path from A to F?
distance= 11, path= $A \rightarrow B \rightarrow D \rightarrow C \rightarrow F$

done	Α	В	С	D	E	F
	0, nil	∞,nil	∞,nil	∞,nil	∞,nil	∞,nil
Α		1,A	8,A	-		-
В			8,A	4,B	5,B	_
D			5,D 🕶		5,B	13,D
С					5,B	11,C
E						11,C
С						

pred[B]= A: $A \rightarrow B \rightarrow D \rightarrow C \rightarrow F$

pred[D]= B: B \rightarrow D \rightarrow C \rightarrow F

> pred[C]= D: $D \rightarrow C \rightarrow F$

pred[F]= C, that is we came to F from C: C→F

the shortest distance from A to F is 11

Dijkstra's Algorithm as a (special) BFS

Basic idea

if $s \rightarrow A \rightarrow B$ is a shortest path then $s \rightarrow A$ is a shortest path.

Init:

 start with dist[s] = 0, and dist[*] = , set unvisited set = V

Round 1:

- choose node with min dist[], which is s;
- visit all nodes u adjacent to s and update dist[u];
- mark s as visited (remove it from the unvisited_set);

Round 2:

- choose the node with min dist[] from unvisited set
- do the other steps as in Round 1

Dijkstra's algorithm [conceptual only]

Purpose: Find shortest path from vertex s

```
set dist[u] = \infty, pred[u]=nil for all u,
set dist[s] = 0;
Insert all pair (dist[u], pred[u]) into a min PQ
while (PQ is not empty):
  remove u from PQ ( dist[u] is smallest)
  mark: found shortest path for u
   for all (u,v) in G:
     if (dist[v] > dist[u]+w(u,v):
            update (dist[v],pred[v]) in PQ
```

Dijkstra's Algorithm

Learn more about the algorithm, and its complexity in the lectures

Exercise

For a directed graph with the edges listed in LHS: **Data** a b 3 1. Draw a weighted directed graph that reflects these a d 7 edges and weights (logical representation). 2. Construct an adjacency matrix for the weighted digraph **b** d 2 you have just drawn, including the weights. Be explicit about how you are going to handle matrix cells for c e 6 which there is no information in the data. d b 2 3. Run through Dijkstra's Algorithm starting from the d c 5 vertex a. d e 4 e d 2

Lab: Peer Programming Exercises

- Do the exercise in previous page
- If you didn't do the priority queue exercise from the bonus workshop, the sample solution will likely solve you a lot of work
- A couple of sets of practice problems are also provided in week10-practice-problems.pdf — If you're struggling with the Dijkstra task, this may help with the conceptual lead-in
- Grady will also release his .ppt with some detailed slides

Lab:

- Implement priority queue (see LMS):
 - you can use your heap implementation from previous weeks
